

Program-Level Assessment: Annual Report

Program Name (no acronyms): Computer Science.

Department: Computer Science

Degree or Certificate Level: MS

College/School: School of Science and Engineering

Date (Month/Year): September 2023

Assessment Contact: Erin Chambers

In what year was the data upon which this report is based collected? AY 2022-2023

In what year was the program's assessment plan most recently reviewed/updated? 2018

Is this program accredited by an external program/disciplinary/specialized accrediting organization or subject to state/licensure requirements? No

If yes, please share how this affects the program's assessment process (e.g., number of learning outcomes assessed, mandated exams or other assessment methods, schedule or timing of assessment, etc.):

1. Student Learning Outcomes

Which of the program's student learning outcomes were assessed in this annual assessment cycle? (Please provide the complete list of the program's learning outcome statements and **bold** the SLOs assessed in this cycle.)

This year, assessment was targeted at the following outcome:

PLO 5- Recognize professional responsibilities and make informed judgments in computing practice based on legal and ethical principles.

2. Assessment Methods: Artifacts of Student Learning

Which artifacts of student learning were used to determine if students achieved the outcome(s)? Please describe the artifacts in detail, identify the course(s) in which they were collected, and if they are from program majors/graduates and/or other students. Clarify if any such courses were offered a) online, b) at the Madrid campus, or c) at any other off-campus location.

CSCI 5050: Students were asked to submit a final paper on a topic in ethically responsible computing. The paper was required to be 2000 to 2500 words long. The audience was graduate students, and the assessment was scaffolded by a 10-minute presentation and an individual meeting with the instructor. Students were assessed on the focus and the depth of their discussion as well as their ability to integrate ethical perspectives from their own research or course work. The rationale for the rubric criteria Topic Focus and Depth of Discussion is a direct result of LLMs like ChatGPT becoming widely available. LLMs are terrific at superficial and broad discussions but some non-proficient students do not prompt for depth or detail.

At the end of Fall 2022, many students were leaning too heavily on ChatGPT and other LLMs to the detriment of their final paper grades. Another assessment was introduced to increase both accountability and the chance to demonstrate bare knowledge of issues in socially responsible software development. A simple multiple-choice section on an in-class exam seems to both test for an initial awareness of some of the major disasters in software development and scaffolds for selection of paper and presentation topics. The required textbook has plenty of examples and is a good resource for initial discussion of the relevant issues.

3. Assessment Methods: Evaluation Process

What process was used to evaluate the artifacts of student learning, and by whom? Please identify the tools(s) (e.g., a rubric) used in the process and **include them in/with this report document** (please do not just refer to the assessment plan).

The rubric used to assess the final paper is in Appendix A of this document. The first 3 criteria are particularly relevant for determining their ethical and legal assessment, but overall student performance is shared below since picking topics and sources is also relevant to their ability to make informed decisions regarding ethically controversial issues.

The multiple-choice exam (introduced in Spring 23 is designed to incentivize bare knowledge of the central issues in socially responsible technology design and implementation. Both historical and recent examples of problematic issues in technology are discussed in the book and integrated into the multiple-choice question bank. The book also introduces legal and professional issues that are germane to artificial intelligence in the professional world.

4. Data/Results

What were the results of the assessment of the learning outcome(s)? Please be specific. Does achievement differ by teaching modality (e.g., online vs. face-to-face) or on-ground location (e.g., STL campus, Madrid campus, other off-campus site)?

Final Paper (F22&S23)				Data covers all students in AI-MS, CS-MS, and SE-MS programs.
Fail	Failure/Novice	9	5.88%	
D/C Range	Apprentice	63	41.18%	
B	Proficient	46	30.07%	
A	Excellent	35	22.88%	
TOTAL		153	100.00%	
Midterm Multiple Choice (S23)				Data covers all students in MS-AI, MS-CS, and MS-SE programs
D or Below	Failure/Novice	22	32%	
C	Apprentice	20	29%	
B	Proficient	25	36%	
A	Excellent	2	3%	

5. Findings: Interpretations & Conclusions

What have you learned from these results? What does the data tell you? Address both a) learning gaps and possible curricular or pedagogical remedies, and b) strengths of curriculum and pedagogy.

A significant number of students fail to achieve proficiency for the lowest levels of Bloom’s Taxonomy in the newly introduced multiple-choice test. While the data indicates acceptable scores for the final paper. Many

students are merely regurgitating AI-generated answers, and this likely accounts for the papers that fall within the D/C range.

For the multiple-choice parts, students are not reading the book or are unable to read the book because of language proficiency issues. Part of the reason that the textbook was introduced was to lower the reading level required to reflect on the issues in AI and technology. The course is designed to lower some of the stakes of these assessments by frequent formative in-class activities, and the paper and presentation are scaffolded via multiple assignments like topic choice and bibliography development workshops and check-ins.

6. Closing the Loop: Dissemination and Use of Current Assessment Findings

A. When and how did your program faculty share and discuss the results and findings from this cycle of assessment?

The faculty discussed these assessment issues and saw pilot results from the Summer 2023 semester where the final paper was replaced with a presentation as the primary summative assessment. Given the issues surrounding academic integrity and LLMs, no faculty member objected to this change, so this will be implemented more strategically in the Fall of 2023.

There are certainly equity issues surrounding the assessment of many of these students, and many of the students take every assignment as equally high stakes, so continued academic integrity issues are likely. The introduction of the textbook, while initially an attempt to increase equity, may have backfired. The textbook though reasonably priced may create a financial strain or further exacerbate language comprehension issues. Alternative textbooks will be researched, but it doesn't appear that any Open Access materials fit the needs of the course. It is likely that the minimum TOEFL scores will have to be adjusted to account for this disparity as well.

B. How specifically have you decided to use these findings to improve teaching and learning in your program? For example, perhaps you've initiated one or more of the following:

Changes to the Curriculum or Pedagogies

- Course content
- Teaching techniques
- Improvements in technology
- Prerequisites
- Course sequence
- New courses
- Deletion of courses
- Changes in frequency or scheduling of course offerings

Changes to the Assessment Plan

- Student learning outcomes
- Artifacts of student learning
- Evaluation process
- Evaluation tools (e.g., rubrics)
- Data collection methods
- Frequency of data collection

Please describe the actions you are taking as a result of these findings.

The summative assessment will be changed to a 10-minute presentation and further scaffolding will be introduced to de-incentivize the use of plagiarism software like ChatGPT. The assessment will still focus on the depth and cohesiveness of the presentation, so they can demonstrate a mastery of the ethical issues.

The multiple-choice assessment will be revised based on some research presented at the Culturally Responsive Teaching Institute. The questions will be simplified, but they will still be based on the textbook. The Assessment Committee will research alternative more accessible material from both a financial and a language-proficiency textbook, but there is a tension between accessibility and the goals of the course as a graduate-level course.

If no changes are being made, please explain why.

7. Closing the Loop: Review of Previous Assessment Findings and Changes

A. What is at least one change your program has implemented in recent years as a result of previous assessment data?

In the prior year, the faculty collectively agreed that theory offerings for the MS level classes were not working. Fall 2022 was the first year that CSCI 5100, a new required MS and PhD level theory course, was offered. We opted not to assess it, to give it a year of being offered, but reports from the faculty member teaching indicate it was much more effective as far as introducing graduate students to fundamentals, as their background did not involve stronger theory offerings from oversea degrees. The class has been taught at a large size, incorporating significant auto-graded work for the first time, to allow students multiple opportunities to master the content.

While not formally assessed in the prior round, discussions and course reflections from the AI-area faculty also focused on the growth of interest in this area, as well as the need to update content in different courses. As a result, fall 2023 saw a major restricting of the content in the AI track classes, with a new “applied ML” course being offered as well as new electives related to computer vision and deep learning. The assessment plan will need to be revised in the coming year to include some of this content.

B. How has the change/have these changes identified in 7A been assessed?

So far, only via graded materials in the class. Full assessment will take place in the next round of evaluating theory, to allow the instructor several iterations of the course to solidify content before a full assessment discussion occurs.

C. What were the findings of the assessment?

Class materials indicate significantly higher understanding and lower drop rates. Again, this is not a full and formal assessment, but is encouraging preliminary data.

D. How do you plan to (continue to) use this information moving forward?

We will continue to offer this class each semester, and the theory faculty will meet in between full assessment to discuss progress and course content.

The other notable issue from the prior round, while not directly related to 7A, was the lack of completed assessment in adjunct-taught courses. Faculty in the software engineering track have taken the lead in compiling a plan for common assessed content in any course in the required sequence.

IMPORTANT: Please submit any assessment tools (e.g., artifact prompts, rubrics) with this report as separate attachments or copied and pasted/appended into this Word document. Please do not just refer to the assessment plan; the report should serve as a stand-alone document. Thank you.
